## Week4 monday

Recap so far: In DFA, the only memory available is in the states. Automata can only "remember" finitely far in the past and finitely much information, because they can have only finitely many states. If a computation path of a DFA visits the same state more than once, the machine can't tell the difference between the first time and future times it visits this state. Thus, if a DFA accepts one long string, then it must accept (infinitely) many similar strings.

**Definition** A positive integer p is a **pumping length** of a language L over  $\Sigma$  means that, for each string  $s \in \Sigma^*$ , if  $|s| \ge p$  and  $s \in L$ , then there are strings x, y, z such that

$$s = xyz$$

and

$$|y| > 0$$
, for each  $i \ge 0$ ,  $xy^i z \in L$ , and  $|xy| \le p$ .

**Negation**: A positive integer p is **not a pumping length** of a language L over  $\Sigma$  iff

$$\exists s \left( |s| \ge p \land s \in L \land \forall x \forall y \forall z \left( (s = xyz \land |y| > 0 \land |xy| \le p) \rightarrow \exists i (i \ge 0 \land xy^i z \notin L) \right) \right)$$

Informally:

Restating **Pumping Lemma**: If L is a regular language, then it has a pumping length.

**Contrapositive**: If L has no pumping length, then it is nonregular.

The Pumping Lemma *cannot* be used to prove that a language *is* regular. The Pumping Lemma **can** be used to prove that a language *is not* regular. *Extra practice*: Exercise 1.49 in the book.

**Proof strategy**: To prove that a language L is **not** regular,

- Consider an arbitrary positive integer p
- Prove that p is not a pumping length for L
- Conclude that L does not have any pumping length, and therefore it is not regular.

**Example**:  $\Sigma = \{0, 1\}, L = \{0^n 1^n \mid n \ge 0\}.$ 

Fix p an arbitrary positive integer. List strings that are in L and have length greater than or equal to p:

\_\_\_\_\_

Pick s =

Suppose s = xyz with  $|xy| \le p$  and |y| > 0.

Then when i =,  $xy^i z =$ 

**Example**:  $\Sigma = \{0, 1\}, L = \{ww^{\mathcal{R}} \mid w \in \{0, 1\}^*\}.$ 

Fix p an arbitrary positive integer. List strings that are in L and have length greater than or equal to p:

Pick s =

Suppose s = xyz with  $|xy| \le p$  and |y| > 0.

Then when i =,  $xy^i z =$ 

**Example**:  $\Sigma = \{0, 1\}, L = \{0^j 1^k \mid j \ge k \ge 0\}.$ 

Fix p an arbitrary positive integer. List strings that are in L and have length greater than or equal to p:

Pick s =

Suppose s = xyz with  $|xy| \le p$  and |y| > 0.

Then when i =,  $xy^i z =$ 

Example:  $\Sigma = \{0, 1\}, L = \{0^n 1^m 0^n \mid m, n \ge 0\}.$ 

Fix p an arbitrary positive integer. List strings that are in L and have length greater than or equal to p:

Pick s =

Suppose s = xyz with  $|xy| \le p$  and |y| > 0.

Then when i =,  $xy^i z =$

Extra practice:

| $s \in L$ | $s \notin L$ | Is the language regular or nonregular? |
|-----------|--------------|--|
|           |              |  |
|           |              |  |
|           |              |  |
|           |              |  |
|           |              |  |
|           |              |  |
|           |              |  |
|           | $s \in L$    | $s \in L$ $s \notin L$                 |

## Week3 friday

**Theorem:** For an alphabet  $\Sigma$ , For each language L over  $\Sigma$ ,

L is recognized by some DFA iff L is recognized by some NFA iff L is described by some regular expression

If (any, hence all) these conditions apply, L is called **regular**.

**Prove or Disprove**: There is some alphabet  $\Sigma$  for which there is some language recognized by an NFA but not by any DFA.

**Prove or Disprove**: There is some alphabet  $\Sigma$  for which there is some finite language not described by any regular expression over  $\Sigma$ .

**Prove or Disprove**: If a language is recognized by an NFA then the complement of this language is not recognized by any DFA.

| Set   | Cardinality |
|---|-------------|
| $\{0,1\}$   |             |
| $\{0,1\}^*$                                       |             |
| $\mathcal{P}(\{0,1\})$                            |             |
| The set of all languages over $\{0, 1\}$          |             |
| The set of all regular expressions over $\{0,1\}$ |             |
| The set of all regular languages over $\{0, 1\}$  |             |
|   |             |

**Pumping Lemma** (Sipser Theorem 1.70): If A is a regular language, then there is a number p (a *pumping length*) where, if s is any string in A of length at least p, then s may be divided into three pieces, s = xyz such that

- |y| > 0
- for each  $i \ge 0, xy^i z \in A$
- $|xy| \le p$ .

**True or False**: A pumping length for  $A = \{0, 1\}^*$  is p = 5.

**True or False**: A pumping length for  $A = \{1, 01, 001, 0001, 00001\}$  is p = 4.

**True or False**: A pumping length for  $A = \{0^{j}1 \mid j \ge 0\}$  is p = 3.

**True or False**: For any language A, if p is a pumping length for A and p' > p, then p' is also a pumping length for A.
